`CP-package` *Conditional Power Calculations*

Description

This package provides several functions for calculating the conditional power for different models in survival time analysis within randomized clinical trials with two different treatments to be compared and survival as an endpoint.

Details

Package:	CP
Type:	Package
Version:	1.6
Date:	2016-06-28
License:	GPL-3

This package could be some help when you want to calculate the conditional power at the time of an interim analysis of a randomized clinical trial with survival as an endpoint.

The conditional power is defined as the probability of obtaining a significant result at the end of the trial when the real effect is equal to the expected effect given the data from the interim analysis.

Functions for the model with exponential survival (`ConPwrExp`) and the non-mixture models with exponential (`ConPwrNonMixExp`), Weibull type (`ConPwrNonMixWei`) and Gamma type survival (`ConPwrNonMixGamma`) are provided.

There is also the function `CompSurvMod` to compare the four mentioned models.

Additionally, there is also a function for the exponential model with the original formulae of the Andersen paper (`ConPwrExpAndersen`).

Finally, the user is able to generate further data frames by random via `GenerateDataFrame`.

Note

The theoretical results of this implementation are based on some assumptions.
Non-Mixture-Exponential: $\lambda[1] = \lambda[2]$
Non-Mixture-Weibull: $\lambda[1] = \lambda[2]$ and $k[1] = k[2]$
Non-Mixture-Gamma: $a[1] = a[2]$ and $b[1] = b[2]$

In general, such assumptions are not fulfilled when using real data.

Nevertheless, when doing conditional power calculations the situation is that you have no significant difference at the time of interim analysis. In this case, no treatment arm is superior to the other one. Thus, the assumptions named above are approximately satisfied.

In contrast to this, caution should be exercised when calculating the conditional power in the case of significant results at the time of interim analysis.

test

Examples

```
# data frame 'test' generated by 'GenerateDataFrame'

# conditional power calculations
# within the exponential model
ConPwrExp(data = test, cont.time = 12, new.pat = c(2.5, 2.5),
          theta.0 = 0.75, alpha = 0.05,
          disp.data = TRUE, plot.km = TRUE)

# conditional power calculations
# within the non-mixture model with exponential survival
ConPwrNonMixExp(data = test, cont.time = 12, new.pat = c(2.5, 2.5),
                theta.0 = 0.75, alpha = 0.05,
                disp.data = TRUE, plot.km = TRUE)

# conditional power calculations
# within the non-mixture model with Weibull type survival
ConPwrNonMixWei(data = test, cont.time = 12, new.pat = c(2.5, 2.5),
                theta.0 = 0.75, alpha = 0.05,
                disp.data = TRUE, plot.km = TRUE)

# conditional power calculations
# within the non-mixture model with Gamma type survival
ConPwrNonMixGamma(data = test, cont.time = 12, new.pat = c(2.5, 2.5),
                  theta.0 = 0.75, alpha = 0.05,
                  disp.data = TRUE, plot.km = TRUE)

# conditional power calculations
# within the four mentioned models
CompSurvMod(data = test, cont.time = 12, new.pat = c(2.5, 2.5),
            theta.0 = 0.75, alpha = 0.05,
            disp.data = TRUE, plot.km = TRUE)

# conditional power calculations
# within the exponential model
# with the original formulae of the Andersen paper
ConPwrExpAndersen(data = test, cont.time = 12, new.pat = c(2.5, 2.5),
                  theta.0 = 0.75, alpha = 0.05,
                  disp.data = TRUE, plot.km = TRUE)
```

CalcConPwrExp *Auxiliary Function*

Description

Calculates the conditional power in the exponential model.

CompSurvMod *Conditional Power (Comparison)*

Description

Calculates the conditional power within the exponential model and the non-mixture models with exponential, Weibull type and Gamma type survival.

Usage

```
CompSurvMod(data, cont.time, new.pat = c(0, 0),
            theta.0 = 1, alpha = 0.05,
            disp.data = FALSE, plot.km = FALSE)
```

Arguments

data	Data frame which consists of at least three columns with the group (two different expressions) in the first, status (1 = event, 0 = censored) in the second and event time in the third column.
cont.time	Period of time of continuing the trial.
new.pat	2-dimensional vector which consists of numbers of new patients who will be recruited each time unit (first component = group 1, second component = group 2) with default at (0, 0).
theta.0	Originally postulated clinically relevant difference (hazard ratio = hazard of group 2 / hazard of group 1) with default at 1.
alpha	Significance level for conditional power calculations with default at 0.05.
disp.data	Logical value indicating if all calculated data should be displayed with default at FALSE.
plot.km	Logical value indicating if Kaplan-Meier curves and estimated survival curves according to the four mentioned models should be plotted with default at FALSE.

Details

This function calculates the conditional power within the exponential model and the non-mixture models with exponential, Weibull type and Gamma type survival and plots the conditional power curves.

Optionally, further data will be displayed. This includes data from interim analysis, log-likelihoods, AICs, calculated estimators and further patient times.

Moreover, it is possible to plot the Kaplan-Meier curves and the estimated survival curves according to the four mentioned models.

Value

See Details.

Returns a list which consists of the following components:

`lambda1.hat.exp`
: estimated hazard of group 1 within the exponential model

`lambda2.hat.exp`
: estimated hazard of group 2 within the exponential model

`theta.hat.exp`
: estimated hazard ratio = estimated hazard of group 2 / estimated hazard of group 1 within the exponential model

`gamma.theta.0.exp`
: conditional power within the exponential model

`lambda1.hat.nm.exp`
: estimated rate parameter of group 1 within the non-mixture model with exponential survival

`c1.hat.nm.exp`
: estimated survival fraction of group 1 within the non-mixture model with exponential survival

`lambda2.hat.nm.exp`
: estimated rate parameter of group 2 within the non-mixture model with exponential survival

`c2.hat.nm.exp`
: estimated survival fraction of group 2 within the non-mixture model with exponential survival

`theta.hat.nm.exp`
: estimated hazard ratio = log(estimated survival fraction of group 2) / log(estimated survival fraction of group 1) within the non-mixture model with exponential survival

`gamma.theta.0.nm.exp`
: conditional power within the non-mixture model with exponential survival

`lambda1.hat.nm.wei`
: estimated scale parameter of group 1 within the non-mixture model with Weibull type survival

`k1.hat.nm.wei`
: estimated shape parameter of group 1 within the non-mixture model with Weibull type survival

`c1.hat.nm.wei`
: estimated survival fraction of group 1 within the non-mixture model with Weibull type survival

`lambda2.hat.nm.wei`
: estimated scale parameter of group 2 within the non-mixture model with Weibull type survival

`k2.hat.nm.wei`
: estimated shape parameter of group 2 within the non-mixture model with Weibull type survival

`c2.hat.nm.wei`
: estimated survival fraction of group 2 within the non-mixture model with Weibull type survival

`theta.hat.nm.wei`
: estimated hazard ratio = log(estimated survival fraction of group 2) / log(estimated survival fraction of group 1) within the non-mixture model with Weibull type survival

`gamma.theta.0.nm.wei`
: conditional power within the non-mixture model with Weibull type survival

`a1.hat.nm.gamma`
: estimated shape parameter of group 1 within the non-mixture model with Gamma type survival

`b1.hat.nm.gamma`
: estimated rate parameter of group 1 within the non-mixture model with Gamma type survival

`c1.hat.nm.gamma`
: estimated survival fraction of group 1 within the non-mixture model with Gamma type survival

`a2.hat.nm.gamma`
: estimated shape parameter of group 2 within the non-mixture model with Gamma type survival

`b2.hat.nm.gamma`
: estimated rate parameter of group 2 within the non-mixture model with Gamma type survival

`c2.hat.nm.gamma`
: estimated survival fraction of group 2 within the non-mixture model with Gamma type survival

`theta.hat.nm.gamma`
: estimated hazard ratio = log(estimated survival fraction of group 2) / log(estimated survival fraction of group 1) within the non-mixture model with Gamma type survival

`gamma.theta.0.nm.gamma`
: conditional power within the non-mixture model with Gamma type survival

Note

There are several mechanisms to ensure that no illegal operations will be done and maximum likelihood calculations will be executed stable. That is why there should not be too less data in the data frame, for example one patient of each group and both being censored.

GenerateDataFrame
test

Examples

```
# data frame 'test' generated by 'GenerateDataFrame'

# conditional power calculations
# within the four mentioned models
CompSurvMod(data = test, cont.time = 12, new.pat = c(2.5, 2.5),
            theta.0 = 0.75, alpha = 0.05,
            disp.data = TRUE, plot.km = TRUE)
```

ConPwrExp *Conditional Power (Exponential)*

Description

Calculates the conditional power within the exponential model.

Usage

```
ConPwrExp(data, cont.time, new.pat = c(0, 0),
          theta.0 = 1, alpha = 0.05,
          disp.data = FALSE, plot.km = FALSE)
```

Arguments

data	Data frame which consists of at least three columns with the group (two different expressions) in the first, status (1 = event, 0 = censored) in the second and event time in the third column.
cont.time	Period of time of continuing the trial.
new.pat	2-dimensional vector which consists of numbers of new patients who will be recruited each time unit (first component = group 1, second component = group 2) with default at (0, 0).
theta.0	Originally postulated clinically relevant difference (hazard ratio = hazard of group 2 / hazard of group 1) with default at 1.
alpha	Significance level for conditional power calculations with default at 0.05.
disp.data	Logical value indicating if all calculated data should be displayed with default at FALSE.
plot.km	Logical value indicating if Kaplan-Meier curves and estimated survival curves according to the exponential model should be plotted with default at FALSE.

Details

This function calculates the conditional power within the exponential model, i. e.

$$S(t) = e^(- \lambda t)$$

for all $t \geq 0$ and $\lambda > 0$, and plots the conditional power curve.

Optionally, further data will be displayed. This includes data from interim analysis, log-likelihoods, AICs, calculated estimators and further patient times.

Moreover, it is possible to plot the Kaplan-Meier curves and the estimated survival curves according to the exponential model.

Value

See Details.

Returns a list which consists of the following components:

`lambda1.hat`	estimated hazard of group 1
`lambda2.hat`	estimated hazard of group 2
`theta.hat`	estimated hazard ratio = estimated hazard of group 2 / estimated hazard of group 1
`gamma.theta.0`	conditional power

Note

There are several mechanisms to ensure that no illegal operations will be done. That is why there should not be too less data in the data frame, for example one patient of each group and both being censored.

`disp.data`	Logical value indicating if all calculated data should be displayed with default at FALSE.
`plot.km`	Logical value indicating if Kaplan-Meier curves and estimated survival curves according to the non-mixture model with Gamma type survival should be plotted with default at FALSE.

Details

This function calculates the conditional power within the non-mixture model with Gamma type survival, i. e.

$$S(t) = c^{(}\Gamma^{(}0)(a, bt))$$

for all $t \geq 0$, $a > 0$, $b > 0$ and $0 < c < 1$ with $\Gamma^{(}0)$ being the regularized incomplete Gamma function of the upper bound, and plots the conditional power curve.

Optionally, further data will be displayed. This includes data from interim analysis, log-likelihoods, AICs, calculated estimators and further patient times.

Moreover, it is possible to plot the Kaplan-Meier curves and the estimated survival curves according to the non-mixture model with Gamma type survival.

Value

See Details.

GenerateDataFrame *Generating Data Frame*

Description

Generates a data frame for conditional power calculations.

Usage

```
GenerateDataFrame()
```

Details

This function generates a data frame for testing the conditional power calculating functions.

Its data is generated by random in the following way:

The number of all patients is a realization of a Poisson distributed random variable with parameter 200.

The probability of censoring is a realization of a uniform distributed random variable of the interval from 0.4 to 0.6, one random variable for each of the two groups 'A' and 'B'.

The patients are randomized to group 'A' or 'B' each with probability 0.5.

The status (1 = event, 0 = censored) is a realization of a Bernoulli random variable with parameter (1 - probability of being censored).

The event time is a realization of an exponential random variable with parameter (1 - probability of being censored).

Value

This function returns a data frame consisting of three columns: the group ('A' or 'B') in the first ('group'), the status (o or 1) in the second ('stat') and the event time in the third column ('time').

Note

Of course, this is only one and also a quiet simple way of generating data frames for interim analysis. Such a generated data frame should be more an aid to get to know the conditional power caluclating functions than simulating realistic data.

Examples

```
# generate a data frame
data <- GenerateDataFrame()
```

`InitValLikelihoodNonMixExp` *Auxiliary Function*

Description

Calculates initial values for maximum likelihood calculations in the non-mixture model with exponential survival.

Author(s)

Andreas Kuehnapfel

See Also

`CP` `ConPwrNonMixExp`

`InitValLikelihoodNonMixGamma` *Auxiliary Function*

Description

Calculates initial values for maximum likelihood calculations in the non-mixture model with Gamma type survival.

test *Test Data Frame*

Description

The data frame 'test' is generated by random and does not refer to a special realistic issue.

Format

This data frame consists of three columns. The first column consists of the group expressions 'A' and 'B' (character). The second column consists of the status 1 for event or 2 for censored (numeric). The third column consists of the event time (numeric).
